

Excerpts from an interview with
Floris Van Foreest
*Business Development Manager,
Port of Amsterdam*

Key issues from port perspective:

Timing of projects on both supply and demand side are not in balance at the moment. This creates uncertainty in the market. As Port, we aim to take away some of the hurdles by providing a clear perspective on the availability of required infrastructure.

Financial framework for H2 production and infrastructure at national government level is not in place yet. This creates uncertainty and delay of projects.

Legal framework of H2 infrastructure is in development. This creates uncertainty among stakeholders that play an important role in the permitting process.

From green hydrogen perspective, a lot more offshore wind has to be developed to fulfill the promise.
